

Technical Architecture

The **DarshanEase – Temple Darshan Ticket Booking System** consists of several interconnected components that work together to provide a secure and efficient online ticket booking experience for devotees.

User Interface

The User Interface is the front-end application through which devotees interact with the system. Users can register, log in, browse available temples, check darshan timings, view slot availability, and book darshan tickets. The interface is designed to be user-friendly and accessible on both desktop and mobile devices.

Web Server

The Web Server hosts the DarshanEase web application and delivers web pages, images, and other resources to users. It acts as the communication layer between the client interface and the backend services.

API Gateway

The API Gateway serves as the central entry point for all client requests. It receives requests from the frontend application, validates them, and forwards them to the appropriate backend services such as authentication, temple management, booking, and payment services.

Authentication Service

The Authentication Service manages user registration, login, and authorization. It verifies user credentials using secure authentication mechanisms such as JWT (JSON Web Token) and ensures that only authorized users can access protected features of the application.

Database

The Database stores all application data, including user information, temple details, darshan schedules, available time slots, booking records, payment information, and ticket details. It ensures reliable and secure storage of all system data.

Temple Service

The Temple Service manages information related to temples, including temple names, locations, descriptions, images, contact information, facilities, and darshan schedules. It allows users to browse and search for temples before booking tickets.

Slot Availability Service

The Slot Availability Service maintains information about available darshan slots for each temple. It updates slot availability dynamically whenever bookings are made or cancelled, preventing overbooking and ensuring accurate scheduling.

Darshan Timing Service

The Darshan Timing Service manages the daily darshan schedules of each temple. It provides users with available dates and timings, enabling them to select their preferred darshan session.

Booking Service

The Booking Service handles the complete booking process. It validates slot availability, creates booking records, updates seat availability, and stores booking information in the database.

Payment Service

The Payment Service securely processes online payments made by devotees. It records payment status, transaction details, and confirms successful payments before ticket generation.

Ticket Service

The Ticket Service generates electronic darshan tickets after successful booking and payment. Each ticket contains booking details such as temple name, booking ID, devotee information, darshan date, time slot, and ticket status. Users can view or download their tickets for temple entry.

Profile Service

The Profile Service manages user profiles, allowing devotees to update personal information, view booking history, and manage their account details.
